

VoidForm's products protect concrete structures and below-grade utilities from the damaging effects of expansive, seismic, or corrosive soils.

WHY VOIDFORM?

Where you need it, when you need it - Projects throughout Canada are serviced through our Winnipeg location. Five additional locations provide national coverage in the U.S.

Broad range of solutions - Corrugated paper carton void products, plastic void products, and non-corroding utility isolation systems protect walls, slabs, and below-grade utilities.

Large experienced service team - From product education to take-off services to on-site assistance, our team provides customer support from start to finish.

Every project type, every soil condition - VoidForm products have been installed on all types of commercial, industrial, municipal, and residential projects.

PROTECT YOUR PROJECT™

It's time to specify the void systems trusted by more architects, engineers, and contractors.

Canadian Product Overview

Carton Void Systems

CaraCor™* and **Surevoid®** provide uniform support for concrete and other loads applied during placement but degrade over time with the absorption of moisture, making them non-structural. The resulting void space allows the soil to expand without transferring damaging uplift pressure into the structure above.

*CaraCor made in Canada only

CaraCor and SureVoid Applications:

Slabs - SlabVoid® and SureRound PierVoid®

Beams and Walls - WallVoid®/ TrenchVoid®, SureLedge™, and Vertical SeparatorVoid™

Knock Down Systems

BeamVoid® and **FloorVoid®** are available as knock-down (KD) for cost-effective shipping throughout Canada and easy on-site assembly.

Knock-down product components are held together by their unique, slotted design instead of glue and/or staples. Their structural strength is weakened through the absorption of moisture as the concrete sets.

Like other VoidForm carton void products, the interior is composed of a biodegradable, cellular network surrounded by a wax-coated exterior cover.

Knock Down Applications:

Slabs - FloorVoid

Beams and Walls - BeamVoid

Weatherproof Products

StormVoid® is made from flexible, waterproof interior supports that bend before uplift pressure from heaving soils apply damaging stress to the concrete structure above. The network is retained by a corrugated paper cover and will uniformly support fresh concrete loads, even if submerged in standing water.

BackFill Retainer™ is a soil retainer that permanently prevents backfill soils from causing lateral pressure on installed void products or from migrating into a newly created void space. It is made from high-impact polypropylene copolymer (PPC).

StormVoid Applications:

Under concrete slabs, walls and grade beams. Around drilled piers below pier caps. Between concrete structures as vertical separators.
